

Thank you for your choice of the Bachmann Branchline 9F 2-10-0 locomotive.

The mechanism of this model requires running in (without load) for approximately 1 hour in both directions, at moderate speed to allow the gear train to bed in.

This locomotive will run on Second radius curves but will perform better on larger radius curves. Some user fitted parts may not be suitable for use with tight curves. Check the model on your layout before final fitting.

When required sparingly lubricate the motor bearings using a plastic compatible

light oil and the gear train with a model grease.

Body removal

Remove the two screws indicated above. Take care with the injector piping.

DCC Decoder fitting

The model has a NEM 8 pin decoder socket. Run in the model first on DC before fitting the decoder

Plug decoder into the socket following the instructions with the decoder. Pin 1 is marked on the circuit board.

Use the drawbar on its longer setting on tighter curves.

Replacement parts

When ordering parts please quote the catalogue number and livery of the model

Couplings for the model are available in packets from retailers item 36-030

This a detailed scale model for adult collectors not suitable for persons under 14
